Solution Assurance Engine

Document of Approval

Approval pending

The prepared CSCF scenario has reached the release gate. Its ten acceptance requirements are linked to candidate deliverables and simulated verification records. This package supports review; formal approval, residual-risk acceptance and deployment have not occurred.

Package field	Fixed scenario record
Input baseline	CSCF-SAE-NB-001 | version 1.0
Scenario date	11 October 2026
Document of Approval	CSCF-SAE-DOA-001 | version 1.0
Verification result	10 of 10 prepared scenarios marked PASS - SIMULATED
Release status	Ready for demo approval review; formal authorization pending
Operational evidence	Not collected; operating effectiveness remains unobserved

Declared purpose

Create evidence-gated readiness analysis for digital solutions by comparing declared purpose, documentation, implementation, tests and observed behaviour. Deterministic controls govern findings and progression; named humans retain formal decision authority.

Input document identity

SAE-CSCF-New-Build-Brief-v1.0.docx

SHA-256: 90c0e9dafa2ad58447b8434b8a09f7b323438ac0b47dfe71851d745a1f89c772

Evidence boundary

This report is the same prepared document in every demonstration. No code generation, scanners, model calls or real assurance assessment were executed to obtain these records. Scenario results must not be used as evidence about the existing SAE implementation.

Implementation and verification contracts

Implementation contract

Deliver acquisition adapters, confirmed intake, validated knowledge loading, the A-F instrument, independent claim verification, finding lock, deterministic readiness, exact tactic mapping, controlled publication and canonical views. Protect human authority and information boundaries.

Verification contract

Execute SAE-VER-01 through SAE-VER-10 independently against the assessed revision. Include malformed sources, missing proof, fabricated citations, score-versus-blocker conflicts, unmapped tactics, unsupported prose and unauthorized approval attempts.

Release conditions

All ten requirements must have attributable verification evidence on the assessed revision. Mandatory security failures, missing critical evidence and unresolved authority decisions remain blocking. Named humans authorize release after reviewing the package and target environment.

Prepared security and integrity checks

Check family	Scenario verification	Result
Build and dependencies	Candidate structure and dependency policy fixture	PASS - SIMULATED
Secrets and raw source boundary	No secrets or raw files in prepared packet fixture	PASS - SIMULATED
Access and authorization	Unauthorized access and automated approval denial	PASS - SIMULATED
Traceability and evidence integrity	Requirement, citation and package-reference checks	PASS - SIMULATED

Verification independence

The scenario presents separately defined implementation and verification contracts. All acceptance tests include a boundary or negative case. The report records this intended control pattern without claiming that an independent real review occurred.

Requirement traceability

The original requirement identity is preserved throughout candidate work, verification and the release conclusion. Full acceptance criteria follow this matrix.

Input requirement	Implementation deliverable	Verification scenario	Result	Release conclusion
SAE-REQ-01 Safe evidence intake and provenance	Source ingestion manifest and local acquisition adapters	SAE-VER-01 Submit mixed source files with embedded instructions and an unreadable unit; inspect the manifest and confirm that no content is executed.	PASS SIMULATED	Satisfied in scenario; approval pending
SAE-REQ-02 Human confirmed intake	Intake workspace and immutable confirmation snapshot	SAE-VER-02 Attempt analysis before confirmation, confirm an intake containing unknowns, and check snapshot and manifest binding.	PASS SIMULATED	Satisfied in scenario; approval pending
SAE-REQ-03 Governed knowledge snapshot	Knowledge loader with manifest and reference validation	SAE-VER-03 Load valid and invalid knowledge manifests; submit a claim using an unknown object ID and inspect rejection.	PASS SIMULATED	Satisfied in scenario; approval pending
SAE-REQ-04 Complete A to F coverage	Assessment instrument and complete coverage matrix	SAE-VER-04 Run a complete synthetic case and a sparse case; verify all work items are accounted for and missing evidence remains UNKNOWN.	PASS SIMULATED	Satisfied in scenario; approval pending
SAE-REQ-05 Independent verification and finding lock	Claim verifier, adjudication route and finding ledger	SAE-VER-05 Inject fabricated locators, unsupported claims and excessive assurance states; confirm rejection or unresolved status.	PASS SIMULATED	Satisfied in scenario; approval pending
SAE-REQ-06 Deterministic readiness and hard gates	Readiness decision kernel and hard gate rules	SAE-VER-06 Evaluate a high score case containing a blocker and an unevaluated risk; confirm both boundaries remain enforced.	PASS SIMULATED	Satisfied in scenario; approval pending
SAE-REQ-07 Exact tactics and reassessment	Finding to tactic mapping and reassessment workflow	SAE-VER-07 Compare exact ID, keyword-only and unresolved cases; complete a tactic and inspect the still-open finding before reverification.	PASS SIMULATED	Satisfied in scenario; approval pending
SAE-REQ-08 Controlled narrative and publication integrity	Synthesis fact check and publication gate	SAE-VER-08 Insert an unsupported narrative claim and compare publication status with unchanged deterministic readiness.	PASS SIMULATED	Satisfied in scenario; approval pending
SAE-REQ-09 Canonical readiness package and trace	Canonical package, workspace, summary and exports	SAE-VER-09 Render the same fixture in both views and an export; compare package identity, decisions and requirement to evidence links.	PASS SIMULATED	Satisfied in scenario; approval pending
SAE-REQ-10 Information boundaries and human authority	Packet boundary, access controls and authority ledger	SAE-VER-10 Inspect packet fixtures and access denial cases; attempt an automated approval and confirm refusal.	PASS SIMULATED	Satisfied in scenario; approval pending

Acceptance criteria and evidence records

These criteria reproduce the input baseline. PASS means the prepared demonstration record satisfies its scripted criterion; it does not attest to real implementation or production effectiveness.

SAE-REQ-01 Safe evidence intake and provenance

A file containing executable or instruction-like content is never executed. Every acquired unit has a source ID, hash and locator; unreadable units remain explicit limitations.

SAE-VER-01 | Manifest fixture and acquisition boundary test record | PASS - SIMULATED

SAE-REQ-02 Human confirmed intake

Assessment cannot start before confirmation. The confirmed snapshot is hashed and bound to the acquisition manifest; unknown fields remain visible.

SAE-VER-02 | Confirmation gate and snapshot test record | PASS - SIMULATED

SAE-REQ-03 Governed knowledge snapshot

An invalid manifest hash or unknown assessment object prevents activation. Criteria remain separate from case evidence throughout the package.

SAE-VER-03 | Knowledge integrity and reference test record | PASS - SIMULATED

SAE-REQ-04 Complete A to F coverage

The coverage matrix accounts for all 180 work items. Missing evidence produces UNKNOWN; exclusions have recorded applicability reasons.

SAE-VER-04 | 180 item coverage and sparse evidence test record | PASS - SIMULATED

SAE-REQ-05 Independent verification and finding lock

Broken citations and unsupported claims cannot lock. Code evidence cannot establish TESTED status, and test evidence cannot establish OPERATIONALLY_OBSERVED status.

SAE-VER-05 | Citation, independence and evidence ceiling test record | PASS - SIMULATED

Acceptance criteria continued

SAE-REQ-06 Deterministic readiness and hard gates

A case with a high diagnostic score and a mandatory blocker remains blocked. Residual risk remains NOT_DETERMINED without authorized evaluation.

SAE-VER-06 | Non bypassable gate regression record | PASS - SIMULATED

SAE-REQ-07 Exact tactics and reassessment

Keyword similarity alone retrieves no tactic. Unresolved claims retrieve none; completing a mapped tactic does not automatically close its finding.

SAE-VER-07 | Tactic eligibility and finding lifecycle test record | PASS - SIMULATED

SAE-REQ-08 Controlled narrative and publication integrity

Unsupported prose is withheld or replaced with deterministic wording. REPORT_READY does not change readiness or authorize deployment.

SAE-VER-08 | Narrative quarantine and publication separation test record | PASS - SIMULATED

SAE-REQ-09 Canonical readiness package and trace

Workspace and summary display the same package identity and results. Exporting does not recalculate readiness; every decisive finding links to its evidence and governing object.

SAE-VER-09 | Package identity and view consistency test record | PASS - SIMULATED

SAE-REQ-10 Information boundaries and human authority

Provider packet fixtures contain no raw files, pixels or secrets. Unauthorized access is denied, audit records omit credentials, and the Engine cannot grant formal approval.

SAE-VER-10 | Packet, access and authority boundary test record | PASS - SIMULATED

Completed workflow and assurance scope

CSCF stage	Blueprint nodes	Prepared completion record
01 Impact & Applicability Classification	01-04	Register the SAE build intent; Establish the evidence and target state; Map affected boundaries
02 Obligations Selected	05	Activate applicable control packs; Bind obligations to required proof
03 Approved Requirement / Hypothesis	06	Establish the purpose baseline; Freeze ten acceptance requirements
04 Contract Creation	07-08	Prepare the implementation contract; Derive independent verification; Check contract readiness
05 Execution	09-11	Authorize the bounded executor; Prepare acquisition and intake deliverables; Prepare the assessment and control candidate; Capture candidate outputs
06 Compare & Gate	12-16	Review structural and security checks; Verify behavior and negative cases; Challenge gate and tactic boundaries; Complete the requirement proof map
07 Assurance Expansion	17-19	Review assurance across A-F; Check acceptance and remediation status
08 Release Gate & Deployment	20	Assemble the document of approval

Assurance scope

The prepared route covers the local change, affected source and provider boundaries, and whole-solution purpose and governance. Domains A-F are reviewed against all ten build requirements. This is assurance of the proposed SAE build scenario, not a live SAE assessment of another solution.

Remediation and evidence ceilings

No unresolved defect remains in the scripted verification route. Tests do not establish operating effectiveness. Future observations, policy changes or new evidence can reopen findings and require reassessment. Tactic completion alone never authorizes closure.

Human review and release decision

Approval pending

A real release would require the named authorities to review the exact assessed candidate, its evidence, accepted exceptions, target environment and rollback conditions. The demo does not appoint approvers, record a signature, accept residual risk or deploy a solution.

Decision boundary	Required real-world review	Current scenario status
Purpose and acceptance	Product or domain owner	Prepared owner decision only
Security and privacy	Named security/privacy authority as applicable	Simulated checks; no real sign-off
Residual risk	Authorized risk evaluator and accountable owner	NOT_DETERMINED
Production release	Named release approver	APPROVAL PENDING
Operational effectiveness	Version-linked monitoring and reassessment	UNOBSERVED

Demo closing actions

Approve & Deploy and Save & Continue Later both close the view and display DEMO ENDED. Neither action changes this PDF, saves a case, grants real approval or triggers deployment.
